Re: Confirmed Rabies in Cat in Hagerstown

The Washington County Health Department has confirmed rabies in a feral cat located in the 2000 block of Day Road, Hagerstown, MD.

There are known human exposures in the vicinity reported at this time. Exposure is defined as a bite, scratch, or contact of saliva from an infected animal with a mucous membrane, such as the eyes, nose, or mouth.

Health Department personnel have contacted individuals associated with the rabid cat and want to advise residents in the vicinity of the situation and urge caution when dealing with feral cats and other unknown animals. Please contact the Health Department if you live in the vicinity of Day Road, Hagerstown, MD and you have, or know of anyone who might have had, any possible human or animal exposure at the numbers listed below.

Rabies is a viral disease that attacks the nervous system; it is predominantly seen in raccoons, bats, and skunks, as well as in dogs and cats (domestic animals).

Washington County residents are reminded that rabies has been well established in Maryland since 1983, and that all wild or unknown animals should be avoided whenever possible since the possibility of exposure to rabies can occur anywhere and anytime.

Pet owners should remember that the best way to protect themselves, their families, and their pets is to keep their pets and any other animals with which they come into routine contact up-to-date on rabies vaccination.
